

## Powerproject Enterprise

### A proven application for collaborative working across projects

#### Specifically designed for planners

Powerproject was specifically developed for the construction industry and has evolved over the years with ongoing input from our customers to keep in tune with the way that planners work. The Enterprise solution allows a number of people to access and update a central repository of project data so that you can:

- ◆ Optimise efficiency by centrally managing all your projects
- ◆ Empower collaboration by enabling the whole project team to access and work on the same project plan at the same time
- ◆ See the impact in the 3D view as you update the Gantt chart
- ◆ Control project costs, income and cash flow across your portfolio
- ◆ Enhance productivity and utilisation by allocating and tracking resources across multiple projects
- ◆ Improve access to vital information for clients and senior management via automated reports and dashboard views based on accurate, up-to-date data
- ◆ Capture resource effort against tasks using timesheets

Powerproject Enterprise is ideal for teams working within a single project or for empowering visibility across multiple projects, as all updates are synchronised in real-time. It has been used to successfully deliver a wide range of projects from 2 planners sharing data on a site through to large scale construction.

#### Enhanced collaboration throughout the BIM process

Powerproject Enterprise can integrate 3D models into the planning process, to create a 4D schedule. Delivering relevant information to all involved in the BIM process is a key tenet, supported through the use of the Enterprise suite.

**“ We needed the Enterprise version because, unlike in a typical single project, we may have 200 different critical paths which don't interact at all, yet we need to monitor and track resources and cash-flow within the whole contract. ”**

*Graham Roebuck, Chief Planner within Skanska's Infrastructure Services Division*

# Powerproject Enterprise

## Expert support

Our experienced Professional Services team ensure that each Powerproject Enterprise implementation is focused on your requirements – so that the processes, views and templates within the software actively support your workflow.

“Our Elecosoft consultant had to absorb a lot of information to understand the management’s aims, and what the templates required would look like.”

*Cullum Detuners Ltd*

## Standardise processes aligned to your business model:

We can discuss how you run your projects and help you create frameworks within the software specifically modelled on how you work. For example with one customer we explored how Powerproject could be used to set and maintain planning quality standards and provided suitable templates that were not too complicated or prescriptive.

## Implementation

We can advise on the best approach and support your transition to an Enterprise solution. Our consultants have helped many organisations introduce Enterprise to centralise their projects to give better visibility across multiple projects. As part of this process, we can help to streamline your project creation process, allowing quicker creation of new projects with uniform codes and resources.

## Training

We provide a wide range of training courses on how to use our software, but also recognise that sometimes you may have specific requirements that need individual attention. Therefore, tailored training options ensure that the material delivered reinforces the key techniques important to your organisation, and does not waste time on generic examples.

## Data reporting and integration

Powerproject Enterprise enables you update plans, share data and provide quality reports.

- ◆ Quick and easy progress reporting from site, by linking with Site Progress Mobile, a downloadable app enabling mobile users to record the progress of tasks and repetitive events from a remote location against their work as scheduled in an Powerproject project plan
- ◆ With data held in the central database, information can be made available to other systems via our application programming interface. Likewise, data from other business applications can be integrated in
- ◆ A flexible Business Intelligence system allows you to generate high-quality dashboard reports of complex or multiple projects
- ◆ Ideal for providing management and clients with accurate, up-to-date information
